Manifold 0.9.2

Version 0.9.2 (build 25) · 9 November 2026 · Beta for testers

Build 25

An update to 0.9.2, on top of build 24.

- **The picture no longer freezes during long playback.** Rarely, about once every several hours of playback, the picture could freeze in the window and on SDI, and SDI audio went silent, until Manifold was restarted. Manifold now detects this and recovers in under half a second. You see the picture hold for about a third of a second, then jump ahead about 20 frames to catch up. SDI audio plays straight through, with no gap or jump.
- **Files without sound no longer repeat or skip a frame on SDI during long playback.** SDI output now follows the card's own clock for these files. Files with sound are next.
- **Help ▸ Export Diagnostics… now includes a Picture Recovery section.** If you see the picture hold and jump, please send us a diagnostics report: it tells us how often this happens on your system.

Summary

0.9.2 lets you move your settings between Macs, and opens stills and audio-only files. Export Settings and Import Settings carry your keyboard shortcuts and saved streams to another Mac, with streams protected by a password you choose. Manifold now opens still images, shown as macOS shows them and with scopes, and audio-only files such as WAV, Broadcast WAV, AIFF and MP3. Deleting a saved stream now asks first, and PQ in As macOS Shows It stays correct when a window moves to another display.

Highlights

- **Move your settings to another Mac.** Export Settings and Import Settings, in Settings ▸ General, carry your keyboard shortcuts and saved streams, URLs and passphrases included. Streams travel only in a file encrypted with your own password.
- **Importing never changes a stream you already have.** Streams are only ever added, and Undo Import takes an import back.
- **Still images.** PNG, JPEG, TIFF, HDR AVIF, Ultra HDR JPEG and every other format your Mac can read, shown as macOS shows them, with scopes.
- **Audio-only files.** WAV, Broadcast WAV, AIFF, MP3, M4A and AAC open in a player window. Play, seek, loop and meter them.

New

SETTINGS TRANSFER

- **Export Settings.** In Settings ▸ General, choose Export Settings…, then tick Keyboard shortcuts, Saved streams or both. The file ends in .manifoldsettings.
- **Saved streams are exported only in an encrypted file.** The file includes each stream's URL and passphrase, so another Mac can connect without retyping them. You choose a password of at least 12 characters, and it can't be recovered: if you forget it, nobody can open the file, Graviton included. A file with shortcuts only is plain text and needs no password.
- **Import Settings.** Choose Import Settings…, or double-click a .manifoldsettings file, or drop one on a player window. Manifold shows what would change before anything does. Nothing changes until you click Import.
- **Importing streams only adds.** A stream with the same name and URL is skipped. The same name with a different URL or passphrase is added as "Name (copy)". Your existing streams are never changed or removed.
- **Shortcuts can merge or replace.** Merge brings in the file's shortcuts and keeps your others. Replace All makes your shortcuts match the file. A shortcut whose key is already in use is shown unticked for you to decide. One whose key macOS reserves isn't imported, and the preview says why.
- **Undo Import.** The summary after an import has an Undo Import button that takes the whole import back. It asks first when it would remove streams.
- **Restore from Backup.** When an import changes your shortcuts, Manifold saves a backup of them first. Settings ▸ General ▸ Restore from Backup… brings one back. The backup covers shortcuts only, not saved streams, so keep your exported file.

STILLS

- **Manifold opens still images:** every SDR format your Mac can read, plus HDR AVIF and Ultra HDR (gain-map) JPEG. A still is shown as macOS shows it, as in Preview. Manifold's color controls don't apply to a still.
- **Scopes on a still** read the values stored in the file. A gain-map file is scoped from its SDR base image, and the scope header says so.
- **The Inspector** shows a still's size, format, color profile, bit depth and HDR details. For an HDR still, the headroom rows say where each value comes from.

AUDIO-ONLY FILES

- **Manifold opens audio-only files:** WAV, AIFF, Broadcast WAV, MP3, M4A, AAC and movies with no picture. The window shows the file's name and format in place of a picture. Play, seek, loop and meter them, with the same channel declarations as a video file's audio.
- **Channel layout by name.** The Inspector names a file's channel layout, such as 5.1 or 7.1, when macOS can read one from the file. This applies to video files too.
- **Broadcast WAV details.** The Inspector shows a Broadcast WAV file's timecode or time reference, and its origination date.

- **Make Manifold the default app for audio files.** Settings ▸ Files now lists WAV, AIFF, MP3, M4A and AAC alongside MOV, MP4 and MXF. Each type is set on its own, and nothing changes until you choose.
- **Audio at launch.** Settings ▸ DeckLink Output ▸ Audio at launch chooses where sound goes when Manifold starts. The toolbar's audio picker now changes it for the session only. With output off, a pick waits for the next time output starts.

Fixed

STREAMS

- **Deleting a saved stream now asks first.** Deleting removes the stream's saved URL and passphrase from this Mac for good, and there was no confirmation.

COLOR

- **PQ in As macOS Shows It stays correct when you move a window to another display.** Before, the picture could be wrong on the new display until you changed display mode.
- **The transform readout says "white and black"** instead of "Lb/Lw".

FILES

- **With autoplay off, opening a file over one that is playing no longer leaves the transport stuck,** with Pause showing and nothing moving.

INTERFACE AND SHORTCUTS

- **System Services shortcuts keep their keys inside Manifold.** ⇧⌘L for Search With Google, for example, stopped working while Manifold was in front.

Known limitations

STILLS AND AUDIO-ONLY FILES

- **SDI and HDMI send black for a still or an audio-only file.** Output keeps its mode and sends black with silent audio while one is open.
- **Audio-only files play on the Mac even when the audio destination is SDI.** Sending them to SDI comes in 0.9.3.
- **DPX stills aren't supported.**
- **Scopes on a gain-map still show the SDR base image,** not the HDR picture on screen.

SETTINGS TRANSFER

- **The automatic backup covers shortcuts only.** Keep your exported file if you might want your streams back.
- **A forgotten password can't be recovered.** Export again with a new one.

COLOR

- **Very saturated PQ colors in As macOS Shows It differ slightly from QuickTime** (as in 0.9.1). Colors your display can show match.
- PQ or HLG on primaries other than Rec. 2020 or P3-D65 can't be shown as stated, and those overrides are greyed out (as in 0.9.1).

SDI/HDMI OUTPUT

- **During long playback of a file with sound, SDI output can repeat or skip a single frame,** as the output card's clock and your Mac's drift apart: roughly every 15 to 40 minutes, depending on the frame rate and the card. Files without sound are fixed in build 25; files with sound are next.
- **2160p100 and 2160p119.88 output arrive late at the card on every frame** (as in 0.9.1). Use a 1080p mode for these rates.
- Over HDMI, an HLG picture goes out without its HLG signal, so the display isn't told to switch to HLG. SDI carries HLG.
- SDI audio goes silent for up to about a tenth of a second at each seek, scrub release and loop point during file playback.

LIVE STREAMS

- Interlaced streams (SRT, WHEP, HLS, NDI) still go out over SDI as progressive, with both fields woven into each frame. An interlaced NDI source arrives already deinterlaced by NDI.
- After a network stall of a second or more, live sound can stay 10–20 ms late for up to a minute.
- OBS stamps 23.976 fps WHIP video very slightly fast. Through MediaMTX on its default settings, sound and picture drift apart by about a quarter of a second an hour over WHEP. Set `useAbsoluteTimestamp: true` on the MediaMTX path to fix it. Cloudflare Stream corrects it on its own.

Upgrading from 0.9.1

Nothing moves when you upgrade. Your license, saved streams, shortcuts and settings carry over unchanged.

- **Export your settings once you've upgraded.** It's the first way to keep a copy of your saved streams outside Manifold. Use Export Settings..., tick Saved streams, and keep the file and its password somewhere safe.

For testers: what to look at

- **Export and Import Settings.** Follow the test procedure that came with this build. It uses fake streams and a safety copy of your own settings, and takes about 30 minutes.
- **Moving between two Macs.** If you have two, export your streams on one and import them on the other. They should connect with no URL, passphrase or Keychain prompt.
- **Stills against Preview.** Open the same SDR and HDR stills in Manifold and in Preview. They should look the same.
- **Audio-only files,** including multichannel WAV and Broadcast WAV. Does the Inspector name the layout and show the timecode?

- **Default app for audio.** In Settings ▸ Files, make Manifold the default for one audio type, double-click a file of that type, then set it back.

Reporting a problem: Help ▸ Export Diagnostics… saves a report we can read (no license details, and no file names unless you tick the box). For a picture problem, Help ▸ Export Frame for Support… saves the frame itself. Never send us a .manifoldsettings file with your own streams in it, or its password.

About this tester build: it carries extra diagnostics. There is a Debug menu, but it stays hidden unless we ask you to turn it on: one of its items replaces the program audio with a test tone. A few Control-Option key combinations are test shortcuts and connect on their own: ⌃⌥D and ⌃⌥H connect to your first saved SRT or WHEP stream, and ⌃⌥N to the first NDI source on your network. Please avoid them.
